

## **Safety of Melamine Mealtime Products**

While most people know melamine products when they see them, very few people know much about this type of plastic. As one of the industry's foremost producers of melamine mealtime products, Zak Designs is committed to providing accurate information about melamine to help alleviate any concerns our customers might have about the safety of these products.

First and foremost, it is important to understand that finished melamine products are fundamentally different from the raw forms of melamine that have been discovered in food products in the past. During manufacturing, the raw powder is exposed to extreme heat and pressure which transforms it into the hard, durable plastic plates and bowls that most people recognize. These mealtime products are unquestionably safe and have been approved by the U.S. Food and Drug Administration as acceptable food-contact surfaces for many years.

Like all of our products, every Zak melamine item is manufactured to all applicable state, federal, and international regulations and standards. Because Zak Designs maintains such an unwavering commitment to safety, we routinely test all of the products we make for safety and quality. Every test that has ever been performed on our melamine products has demonstrated that these items, like all Zak products, are undeniably safe.

We appreciate the opportunity to alleviate any concerns our customers might have had regarding these articles, and we look forward to the opportunity to continue bringing the safest, and most enjoyable, products to people around the world.
